

ABSTRACT

A plurality of user interface devices 12, a plurality of product delivery stations 14, a plurality of delivery station display devices 16, a plurality of delivery attendant output devices 20, and a main computer 22 in communication with the user interface devices 12, the delivery station display devices 16, and the delivery attendant output devices 20.

The user interface devices 12 receive the orders and payments from customers directly without needing an order-taking attendant, and the computer 22 sends the orders and associated identifiers to one of the delivery station display devices 16 and one of the delivery attendant output devices 20. The customers then match the identifier with the corresponding identifier displayed on the delivery station display devices 16 to determine at which of the delivery stations 14 to pick up their ordered products.
